

# JIS SPRINGS

**Anchor Danly**  
The Brands You Trust

# JIS SPRINGS

## SERVICE WE DELIVER AND QUALITY YOU CAN DEPEND ON

**ANCHOR DANLY** is a leading manufacturer of die and die component products supplied globally to the parts forming industry. Backed by years of tool and die experience, quality and innovation are some of the reasons why our name is respected throughout the world. We have taken the lead role in creating and bringing new products to customers and helping them find solutions that improve their operations. Based on the capabilities **ANCHOR DANLY** offers, we can help you to meet the demands of quick deliveries, technical support, quality products and competitive prices. **ANCHOR DANLY** and its' broad distribution channels and direct sales personnel will assist you in any way to make your product a better and more profitable one.

Whether standard or customized products, with our years of experience, customers can be sure the products they receive will meet their expectations for reliability and dependable performance. We understand the demanding schedules of die builders and production personnel and have developed efficient manufacturing processes to shorten product lead times as well as put inventory on our shelves so you can have it in your facility when you need it. Put the **ANCHOR DANLY** network to work for you. We've got the service you've been looking for.

Included in our full line offering are both inch and metric size die sets and die components that are designed to numerous die standards including ISO, NAAMS, JIS and many large automotive and appliance manufacturers' standards. The complete product offering includes:

- Accu-Bend Rotary Benders
- Air Presses
- Cams
  - Aerial & Diemount Cams
  - Box Cams
  - Modular Cams
  - Roller Cams
  - Wide Cams
- Die Accessories
- Die Sets
  - Plain & Ball Bearing Sets
  - Catalog Ball Bearing Sets
  - Wear Plate Sets
  - Cast Sets
- Ejector Boxes
- Guide Posts & Bushings
  - Plain & Ball Bearing Styles
  - Steel, Bronze, Bronze-Plated &
  - Self-Lubricating Bushings
  - Lempoloy Bushings
  - Special Pins, Bushings & Retainers
- Hydraulics
  - Electronic Die Setters
  - Die Separators
  - Drill & Tap Equipment
  - Hydraulic Motors
- In-Die Tapping Units
- Machined and Cut Ground Plate
  - Adapter Plates
  - Bolster Plates
  - 1020, 1045 & 4140 materials
- Manufacturing Services
  - CNC Machining
  - Blanchard Grinding
  - Stress Relieving
  - Die Set Repair
- Mold Components
  - Bronze Plated & Self-Lubricated Bushings
  - Leader Pins
  - Bronze & Bronze Plated Wear Strips & Ways
- Punches, Buttons & Retainers
- Reliance Fabrications
  - Custom Fabrications
  - Robotic Welding
  - Aluminum & Steel Fixture Bases
- Springs
  - DieMax L Inch Series Springs
  - DieMax XL Series ISO Springs
  - JIS Series Springs
  - Custom Heavy Duty Springs
  - Marsh Mellow Springs
  - Formathane Urethane
  - Kaller Gas Springs
  - Utility & Disc Springs
- Wear Products
  - Plates, Strips, Gibs & Blocks
  - Steel, bronze, Bronze-Plated and Self-Lubricating Materials

## Identi Springs

Have you standardized on non-ISO coded spring colors? Try our Identi spring series striped to make conversion to ISO easier. The Identi springs are available in 4 load ratings including Light (Blue), Medium (Red), Heavy (Gold) and Extra Heavy (Green) loads.

## ISO Springs

ISO die springs are manufactured and color coded to the ISO Standard. The product line consists of four load ratings: Light, Medium, Heavy and Extra Heavy loads.

# General Information

---

## Metric springs conform to the Japanese Industrial Standards (JIS)

For years, we have manufactured high quality springs in all standard ISO sizes and a series of round wire springs, following ISO 9002 quality standards - all in inch sizes. With the springs in this catalog, we are making available a line of true-metric springs, in all the standard JIS sizes and colors.

This extension of the spring line gives more options to customers with exacting requirements, and best of all, makes them available from the same reliable source as the inch springs. If you need help finding a specific heavy-duty compression spring, give us a call.

## Quick Tips to Extend the Life of Your JIS Springs

**Use the longest spring possible:**  
Spring life is directly related to travel distance as a percent of spring length:

**Less travel = longer life.**

**Protect the spring wire surface:**  
The secret to long life is the integrity of the wire surface. Fractures occur when normal spring stresses combine with surface imperfections to create a stress concentration. In order to minimize damage to the spring surface, follow these suggestions:

- 1) Train employees on the value of protecting the wire surface.
- 2) Use a spring cage to protect and keep the spring clean of debris.
- 3) Do not alter the spring - surface integrity is key.

**Purchase springs to the correct length:**

The ends of each spring are closed and ground square to assure that the spring will stand on either end and provide a maximum bearing surface.

**Keep the force and the spring movement linear:**  
A direct force against the spring, precise alignment of spring pockets, and the proper support to keep the spring straight, all ensure long life and maximize spring efficiency.

Torsion, bending (due to lack of support), or diagonal pressure on the spring will shorten the life of the spring.

- 1) Use a spring cage, retainer or alignment rod to support the spring and keep it straight - this is especially important for springs whose length is more than 4 times the diameter.
- 2) Flat surfaces in the spring pockets provide the best support and keep the spring standing straight.

**Keep the springs under pre-load:**  
Spring retainers not only simplify die construction by holding the springs in place, they also keep the springs under pressure to reduce shock.

- 1) The amount of pre-load should be at least 1/6 total travel; more pre-load is better as it reduces travel.
- 2) Faster die operations require greater pre-load to minimize failure due to shock.

**Spring Maintenance:**  
Replace all springs at the same time to keep the die balanced and keep it working like new. Over time, springs lose their force. Replacing springs in just one area of the die may cause an imbalance in the die. The symptom will be a sudden increase in wear on punches, guide pins, bushings and a decrease in spring life.

**Coilers** - Using the latest in CNC coiling technology, springs are produced with much better predictability and consistency in performance, rates and lengths.

**SPC Quality Assurance** - Using SPC software, operators insure that every production process meets our high quality standards.

**Computer Controlled Spring Testing** - Utilizing custom software, spring testers track and verify consistency in spring dimensions and rates.

# Spring Selection Steps

If the diameter and length are known, turn directly to dimension tables on pages 6 through 25 to select springs with desired total load.

If diameter and length are not known, use the following seven spring selection steps and refer to the rate column of the dimension tables for spring selection.

In determining the length of a spring, it should be remembered that maximum delivered spring load is

obtained by selecting longer springs. For best economy and saving of space, choose Extra Light, Light, Medium or the Heavy Load spring having a free length equal to six times the travel, or an Extra Heavy Load spring having a free length equal to eight times the travel. If ratios lower than these are used because of height limitations, the number of springs required will be substantially increased.

## Step 1

Estimate the level of production required of the die - short run, constant production, etc.

## Step 2

Determine compressed spring length "H" and operating travel "T" for the die layout.

## Step 3

Determine free length "C" as follows:

Decide which load classification the spring should be selected from - Extra-Light, Light, Medium, Heavy, or Extra-Heavy Load. Then choose the figure nearest the compressed length "H" required by the die design from the chart on page 5. Read corresponding "C" (free length).

## Step 4

Estimate total initial spring load "L" required for all springs when springs are compressed "X" millimeters.

## Step 5

Determine "X" (initial compression) by using the following formula:

$$X = C - H - T$$

## Step 6

Determine "R" (total rate for all springs in newtons per millimeter) by using the following formula:

$$R = \frac{L}{X}$$

## Step 7

Select springs as follows:

1. The free length "C" must comply with the length determined in Step 3.
2. Divide "R" in Step 6 by the number of springs to be used (if known) in order to get the rate per spring. Then refer to the following pages for the catalog number of springs having the desired rate. If the number of springs is not known, divide "R" from Step 6 by the rate of the spring you select for the correct number of springs.

# Spring Selection Steps

## Spring Cages

Cages are a simple and economical way to extend spring life. They protect wire surfaces from damaging debris and provide a flat surface for the best, most even amount of support. They also protect dies by keeping broken spring pieces out of critical die areas. Spring cages have a black phosphate finish for durability. Install by simply sliding them over the springs at die assembly.

# Spring Accessories

## Spring Retainers

Spring retainers hold individual springs firmly in position while the die is being assembled or disassembled. When a die is disassembled for repairs, only springs needing replacement are released.

Reloading is easy since springs can be set individually, which avoids working against the combined force of a number of springs. Retainers are all-steel construction with a bright zinc plate finish. They can be used with springs having rod diameters of 20mm and 25mm and any length that permits clearance.
